TITLE OF INVENTION

METHOD AND APPARATUS FOR MULTI-CURRENCY FUNDS SETTLEMENT

APPLICANT(S) FOR DO/EO/US

Mark Van Roon and John Booth

Applicant herewith submits to the United States Designated/Elected Office (DO/EO/US) the following items and other information

1. ☒ This is a **FIRST** submission of items concerning a filing under 35 U.S.C. 371.
2. ☐ This is a **SECOND** or **SUBSEQUENT** submission of items concerning a filing under 35 U.S.C. 371.
3. ☒ This is an express request to begin national examination procedures (35 U.S.C. 371(f)). The submission must include items (5), (6), (9) and (24) indicated below.
4. ☒ The US has been elected by the expiration of 19 months from the priority date (Article 31).
5. ☒ A copy of the International Application as filed (35 U.S.C. 371 (c) (2))
 - a. ☒ is attached hereto (required only if not communicated by the International Bureau).
 - b. ☐ has been communicated by the International Bureau.
 - c. ☐ is not required, as the application was filed in the United States Receiving Office (RO/US).
6. ☐ An English language translation of the International Application as filed (35 U.S.C. 371(c)(2)).
 - a. ☐ is attached hereto.
 - b. ☐ has been previously submitted under 35 U.S.C. 154(d)(4).
7. ☒ Amendments to the claims of the International Application under PCT Article 19 (35 U.S.C. 371 (c)(3))
 - a. ☐ are attached hereto (required only if not communicated by the International Bureau).
 - b. ☐ have been communicated by the International Bureau.
 - c. ☐ have not been made; however, the time limit for making such amendments has NOT expired.
 - d. ☒ have not been made and will not be made.
8. ☐ An English language translation of the amendments to the claims under PCT Article 19 (35 U.S.C. 371(c)(3)).
9. ☒ An oath or declaration of the inventor(s) (35 U.S.C. 371 (c)(4)). *unsigned*
10. ☐ An English language translation of the annexes to the International Preliminary Examination Report under PCT Article 36 (35 U.S.C. 371 (c)(5)).
11. ☐ A copy of the International Preliminary Examination Report (PCT/IPEA/409).
12. ☐ A copy of the International Search Report (PCT/ISA/210).

Items 13 to 20 below concern document(s) or information included:

13. ☐ An Information Disclosure Statement under 37 CFR 1.97 and 1.98.
14. ☐ An assignment document for recording. A separate cover sheet in compliance with 37 CFR 3.28 and 3.31 is included
15. ☒ A **FIRST** preliminary amendment.
16. ☐ A **SECOND** or **SUBSEQUENT** preliminary amendment.
17. ☐ A substitute specification.
18. ☐ A change of power of attorney and/or address letter.
19. ☐ A computer-readable form of the sequence listing in accordance with PCT Rule 13ter.2 and 35 U.S.C. 1.821 - 1.825.
20. ☐ A second copy of the published international application under 35 U.S.C. 154(d)(4).
21. ☐ A second copy of the English language translation of the international application under 35 U.S.C. 154(d)(4)
22. ☒ Certificate of Mailing by Express Mail
23. ☒ Other items or information:

Published PCT International Application; Form PCT/IB/308, confirming that the IB communicated the International application to the USPTO; PCT Demand; Notification of Receipt of Demand

PRELIMINARY AMENDMENT

Dear Sir:

Preliminary to a first office action on the merits of this application, please amend the published PCT specification and claims as follows:

In the Specification:

Page 1, between lines 5 and 6, please insert:

--CROSS REFERENCE TO RELATED APPLICATIONS

This application claims the priority of PCT application serial number PCT/GB00/03511, filed on 13 September 2000 and Canadian Patent Application 2,284,400, filed on 13 September 1999 and entitled "Method and Apparatus for Multi-Currency Funds Settlement" by Mark Van Roon and John Booth, the entire contents and substance of which are hereby incorporated in total by reference.--

In the Claims:

Please amend claims 4 and 5 to read as follows:

4. (Amended) The method of claim 1 of any preceding claim in which funds which are transferred to a payee in a given jurisdiction are generated from a series of debits and credits passing back to a debit of cleared funds of a bank account held by a legal person in that same jurisdiction, that legal person not seeking to transfer funds to that payee but to a payee in a different jurisdiction.

5. (Amended) A computer program receiving data defining the non-domestic payment obligations of parties located in two or more countries, and programmed to identify opportunities to satisfy those non-domestic payment obligations by assigning payment obligations using the funds settlement method defined in Claim 1.

REMARKS

The claims have been amended to correct for multiple dependencies.

Attached hereto is the “Marked-Up Version” of this Preliminary Amendment.

If any additional amendments or changes are necessary, the Examiner is respectfully requested to contact applicants' attorney at the telephone number indicated below.

Respectfully submitted,

By  Richard C. Woodbridge

MARKED UP VERSION OF PRELIMINARY AMENDMENT

CROSS REFERENCE TO RELATED APPLICATIONS

This application claims the priority of PCT application serial number PCT/GB00/03511, filed on 13 September 2000 and Canadian Patent Application 2,284,400, filed on 13 September 1999 and entitled "Method and Apparatus for Multi-Currency Funds Settlement" by Mark Van Roon and John Booth, the entire contents and substance of which are hereby incorporated in total by reference.

In the claims

4. (Amended) The method of claim 1 of any preceding claim in which funds which are transferred to a payee in a given jurisdiction are generated from a series of debits and credits passing back to a debit of cleared funds of a bank account held by a legal person in that same jurisdiction, that legal person not seeking to transfer funds to that payee but to a payee in a different jurisdiction.

5. (Amended) A computer program receiving data defining the non-domestic payment obligations of parties located in two or more countries, and programmed to identify opportunities to satisfy those non-domestic payment obligations by assigning payment obligations using the funds settlement method defined in Claim 1 [- 4].

Method and apparatus for multi-currency funds settlement

5

Field of the Invention

The present invention relates to a method of and apparatus for multi-currency funds settlement.

10

Description of the Prior Art

The Internet offers the promise of allowing buyers and sellers of goods and services to communicate directly with one another, eliminating the need for some of the intermediaries and the associated economic inefficiencies present in conventional selling. Hence, for example, it is in 1999 possible to transact many kinds of business using the Internet, which formerly would have required a broker or agent. Examples include the purchase of insurance, airline tickets, books and holidays.

The Internet also enables new models of buying and selling as well: for example, there are now many Internet auction sites, on which a wide range of goods and services are auctioned to the highest bidder, with the seller merely setting a reserve price or a bid start price. The terms to 'buy' and 'sell' and related expressions should be broadly construed to include any kind of transfer of rights or interests; 'buyers' and 'sellers' should be also broadly construed to include any transferee and transferor of any kind of right or interest. The terms 'party' and 'counterparty' are commonly used to describe a situation in which a given party is both a buyer and simultaneously a seller. This can arise, for example, where a party wishes to exchange US\$100 for the equivalent in Sterling. That party is simultaneously a seller of US\$ and a buyer of Sterling.

30

Computer systems linking many potential buyers and sellers of goods and services over an extensive computer network also existed prior to the widespread adoption of

the Internet, particularly in the financial services sector. One example is the foreign exchange dealing systems developed and run by organisations such as Reuters plc and the EBS Partnership. In these systems, banks post the prices at which they are willing to buy or sell defined quantities of currencies. The systems may automatically spot matches – i.e. where a buyer is willing to buy at a price at which a seller is willing to sell – and complete the trade. If a potential buyer of currency can find no-one willing to sell at a price it considers low enough, then typically, that potential buyer will simply have to either wait for the pricing in the market to become more favourable, or else be prepared to pay more. Such systems are commonly used for currency speculation, namely taking a trading position with respect to one or more given currencies to exploit favourable pricing movements.

Where a buyer and seller regularly trade with one another, it is normal to aggregate all transactions over a defined period of time and for just a single net payment to be made. Hence, for example, if party A buys 50 units at \$1 from party B over a week, and counterparty B buys 20 units at \$1 from party A over that same week, then the respective payment obligations can be netted off so that A pays \$30 to B at the end of the week. This same principle applies to the more sophisticated environment of trading foreign exchange and other financial property. Where more than a single party and counter-party pair are involved, for example, a 3 way group or even higher orders, multilateral netting can be applied.

Netting systems should minimize the number of intra and inter company receipts and payments, which incur float costs in the banking system. Netting reduces the total payments (cost and credit structure improvement), the number of transactions (cost and system architecture improvement), and often, the risk in a transaction system (credit structure improvement). To illustrate this concept, if UKCorp1 owes UKCorp2 100 Pounds Sterling and UKCorp2 owes UKCorp3 100 Pounds Sterling, then UKCorp1 could pay UKCorp3 100 Pounds directly thereby reducing the payments from 200 Pounds total to 100 Pounds, and the number of transactions from 2 to 1.

In addition to the need for speculative currency trading, there exists also a very substantial need for corporations to buy and sell foreign currency, for example, to pay overseas suppliers. Similarly, individuals travelling abroad or making foreign investments need to obtain foreign currencies as well. Currently, corporations and individuals will approach a bank or foreign currency vendor (such as American Express Inc.) to obtain foreign currency. The bank or foreign currency vendor will in turn often have obtained its stocks of foreign currency from other banks, in many cases having used an inter-bank trading system such as the Reuters or EBS systems. Because of the chain of intermediaries, the transaction cost of buying or selling foreign exchange in this way is quite high: this is reflected in the commission charged and the difference between the bid and the offer prices: a bank will typically sell foreign currency at a rate considerably higher than the rate at which it will buy it back. For small transactions, the difference can be 4%. For larger transactions, the difference is typically 5 basis points.

The mechanics of cross border payments is quite complex. For example, take the situation, where a company C in the US, with US dollars in a US account, wishes to pay a supplier in England in Sterling. Assume also that company C has to pay a supplier in Sterling but has no Sterling receivables to do so. The typical procedure, required for this transaction to be completed using a wire transfer process is as follows:

A. Funds are debited from C's US home bank account immediately on direction to wire transfer and the US dollar funds credited to the US home bank, typically in a general account. A wire transfer is therefore in respect of "final or cleared funds". Depending on the nature of the transfer, a foreign exchange component may be completed between the originator and his financial institution.

B. In most cases, the wire transfer direction to pay is a "push driven" process, in which funds are directed to the international clearing banks (originating and/or receiving) via SWIFT or a network of correspondent financial institutions. In the case of Company C's funds, the US Dollars now resident in a general account of C's home bank are credited to the account of the correspondent or network bank and the chain of correspondent debits and credits begins until the funds are credited to the ultimate beneficiary account. The "direct clearer" or correspondent bank in the receiving country is ultimately responsible to push the funds to the receiving bank, who subsequently directs the funds to the beneficiary. The domestic component of the wire transfer typically occurs via the domestic payment system. It is common for each country to have multiple international clearing banks that have correspondent relationships with international clearing banks in other countries and that operate domestically with the payment system. Examples include Barclays Bank, Toronto Dominion Bank, Chase Manhattan Bank, The US Federal Reserve.

C. In the case of a US Dollar to Sterling wire transfer, the UK clearer transfers the funds from the US bank's "GBP nostro" account (either the home bank if it has a nostro account or the correspondent US bank having a nostro account) to the account with the UK correspondent bank and then to the bank of the wire transfer receiver (if they are not the same) through the UK domestic payment system. Hence C has met its obligation in the UK. A US FI's GBP nostro is a bank account held at a GB FI in the name of the US FI but holding the currency of the foreign jurisdiction, in this case GBP.

This process is relatively expensive and involves numerous participants: Two international clearers, one per country, typically two correspondent banks having nostro accounts with each other, two home banks one each for receiver and originator, and two transactors, an originator and a receiver. Further to that, a push driven system is open to processing delays as financial institutions seek to maximize the use

of available funds as part of their overnight float and hence only move the funds when absolutely necessary

5 Summary of the Invention

In accordance with a first aspect of the invention, the method of multi-currency funds settlement comprises the following steps:

10 funds in a currency X of a first legal person who is situated in country X¹ are transferred in whole or part within country X¹ to satisfy in whole or part the currency X¹ payment obligations of a second legal person, situated in a different country Y¹;

15 and the funds in a currency Y of that second legal person situated in country Y¹ are transferred in whole or part within country Y¹ to satisfy in whole or part the currency Y payment obligations of a legal person, who may be the first legal person or one or more different or additional legal persons.

Hence, the essential principle is for cross border multi-currency payment obligations to be met not with conventional complex and expensive FX transactions, but instead
20 with legal persons (typically corporations) in different countries in effect assigning, novating, swapping or otherwise altering payment obligations so that funds of a party in one country remain in that country and are used to meet the payment obligations in that country of a party outside of that country. The term 'assigning' will be used in this specification to cover any such kind of alteration of payment obligations and is
25 not limited to a legal or equitable assignment as such.

Clearly, full settlement of payment obligations is unlikely to occur where the total system involves only 2 parties and 2 countries, although this too is possible if both parties have corresponding bank accounts in both of the relevant jurisdictions (4
30 accounts total). The practical realisation of the present invention therefore likely occurs in multi-party, multi country situations, where, given sufficient fund volumes

and diversity, all or virtually all payment obligations can be fully satisfied. With sufficient fund diversity and volumes, most if not all multi-currency cross border settlements can be satisfied using solely domestic transactions: only the residual elements left over after all domestic transactions have been netted off require genuine cross-border settlement. This inherently operates as a risk reduction mechanism as the bank never takes a principal position, but rather acts solely as a custodian. It further reduces the amount that can ever be in dispute by only ever using precleared funds of the various participants. Therefore in the event of a problem which requires transaction unwinding, the most at risk for any party is the gain or loss associated with the interim movement in exchange rates between the relevant currencies.

In a second aspect, there is a computer program receiving data defining the non-domestic payment obligations of parties located in two or more countries, and programmed to identify opportunities to satisfy those non-domestic payment obligations by assigning payment obligations using the funds settlement method defined above.

A third aspect of the invention is a computer server programmed with the computer program of the second aspect.

A fourth aspect is a computer terminal acting as a client, in which the client accepts from a party a foreign exchange requirement and sends that requirement to a server as defined in the third aspect.

A fifth aspect is a computer based system which enables parties located in two or more jurisdictions to meet their foreign currency payment obligations, comprising a first computer terminal into which a party located in a first jurisdiction inputs details of a potential first foreign currency financial transaction, a second computer terminal into which a second party located in a second jurisdiction inputs details of a potential second financial transaction, a computer network connecting the first and second

terminals; characterised in there being a computer program arranged to determine if any transfer of funds from the first party to a payee located in the first jurisdiction satisfies in whole or part the requirement of the second party to transfer funds to that payee. Instead of a merely bi-lateral system, in a practical implementation there may be numerous computer terminals in numerous countries and the computer program is then arranged to determine if any transfer of funds from a party to a payee located in the jurisdiction of that party satisfies in whole or part the requirement of another party to transfer funds to that payee.

The present invention utilises and exploits a special aspect of currency dealing, namely that the currency of any country does not, typically, ever leave that country. That is to say, for example, a US dollar account in Canada is merely a Canadian dollar account with a conversion factor to a US dollar equivalent.

The present invention utilises a computer-based system to restructure the method of payment and settlement to reduce the number of participants, thereby streamlining the procedure and improving efficiency.

Brief Description of the Drawings

The invention will be described in more detail with reference to:

Figure 1 which is a diagram representing the bid/offer pricing for USD priced in CAD;

Figures 2A, 2B and 2C which is a table showing how a FX netting 'hybrid' system can operate;

Figures 3A and 3B, which are schematic depictions of a computer based system which enables buyers and sellers of foreign exchange to be efficiently matched, and

Figure 4, which is a schematic representing the key steps in the system as applied to FX matching; and

Figure 5, which illustrates the mechanics and benefits of transactions netting

Figure 6 which is simplified schematic showing the principle of the payment approach
5 of the present invention

Figure 7 which is a table relating to an example of a series of payments made using the
present invention and

Figure 8 which is a schematic of the computer system for implementing international
payments as defined in the present invention.

Detailed Description

The present invention will be described with reference to various examples, as
15 illustrated in the attached Figures.

Currently, banks broker foreign exchange transactions, providing an intermediary to
purchase and sell currency for both theirs' and their clients' accounts. For each
transaction the bank garners the "spread", typically 5 basis points on large transactions
20 and up to 40% on smaller transactions.

In the present invention, the appropriate underlying transactional software allows one
end user of the foreign exchange (e.g. a first corporation, Corporation A, doing a cross
border procurement) to liaise directly or indirectly with a counterparty, a second
25 corporation, Corporation B, which requires the home currency of Corporation A. The
bank brokering function, as it pertains to the financial instrument itself, can be
reshaped; that is, the spread currently absorbed by the two sample corporations could
be reduced or negated. Each party might therefore improve its cash position by one
half the value of the spread that they would incur, for example on a 5 basis points

WO 01/20508

PCT/CB00/03511

9

spread, the corporation would improve its position by 2.5 basis points. For smaller customers the savings on a percentage basis would be substantially greater.

Moreover, transactions could be executed in a multitude of dimensions: two way; three
5 way; four way; etc, since the software would expose the transactional opportunities available to each of the clients. (This process is described in more detail in Appendices 1 & 3)

The overall system approach can best be understood through a sample problem:

10

Sample problem

Imagine the following:

1. That the spot price of CDNS is US\$ 1.5363 - 1.5373 at November 27/98.
2. That Corporation A is buying US \$1M to purchase equipment at a cost of CDN
15 \$1,537,300.00. Corporation A. has CDN \$1,536,800.00 on account with a bank for the transaction (note: this assumes that the bank provides the best rate to Corporation A).
3. That Corporation B has US\$1M on account with the bank but requires CDNS1,536,300.00 to purchase raw materials.

20

If the bank matches its own funds to supply Corporation A with US\$1M and Corporation B with CDNS1,536,300.00, then it makes a profit of \$1,000.00 per \$million transacted. Although \$1,000 is a very small amount in the context of a
25 significant \$1M transaction, the total global volume of such transactions is extremely large, so that the cumulative profits to banks are very substantial.

25

In the present invention, the following occurs: Corporation A and B agree before transacting that they will do so at an exchange rate that is the mid-point of the posted Interbank rate, for example, the Interbank highest bid, lowest offer at the appropriate
30 time. This is a fair compromise for each participant. Hence, the transaction can be

30

completed automatically, rapidly and efficiently. The party and counterparty each deposit the funds needed to execute a transaction with a financial institution; the funds are preferably pre-cleared and are not marginable through the system. A sophisticated computer program determines that the party and counter-party are taking reciprocal positions, which can be matched against each other and instructs the relevant financial institutions to transfer the required foreign exchange as, in effect, a swap. By matching Corporation A with Corporation B, each of their positions is improved by \$500.00 per million, less a transaction fee to an intermediary of perhaps \$50.00 per side. The result is that Corporation A receives US\$1M for \$1,536,750 per million; a saving of \$450.00 per million; Corporation B Receives \$1,536,850 for US\$1M; an improvement in profit of \$450.00. The system has in effect reduced the spread to 1 basis point. The spread can theoretically be reduced to just short of zero since the present invention operates efficiently and automatically. This example works because of the exactly matching reciprocal requirements of the parties. In practice, that will rarely happen and some sort of netting will be required.

The fundamental netting concept applied in this embodiment is that a computer is programmed with information relating to a party and counterparty transaction, to determine a net payment position if both the first and second transactions were to occur and to actually complete each transaction on the basis of the net payment position.

This approach can be contrasted with conventional netting, in which a transaction is completed and only subsequently does netting occur to reduce the number and size of payments. Typically, there might be several party/counterparty pairs in a connected series of transactions in the present embodiment.

Multilateral Netting Example

In the present system, it will be seen that the netting step is not simply a stage subsequent to but independent from the underlying exchange transaction, performed

for accounting simplicity to reduce the numbers and sizes of cross-payments. Instead, it is an integral part of the underlying exchange transaction between party and counterparty. This is most clearly emphasised when considering a multi-party exchange of currencies. Take, for example, a situation in which there are 3 Corporations - A, B and C. A has CAD and needs JPY; B has JPY and needs USD; C has USD and needs CAD. The exact needs are shown in Figure 2A. A cannot satisfy its requirements in whole or in part by dealing with B exclusively. However, if C can be "linked" into the transaction, all three corporations can be satisfied to the value of the smallest available currency. (A more detailed example with multiple parties and jurisdictions is available for review in Appendices 1, 2, and 3).

We assume that the mid-point of Interbank B/O at a point in time is as follows: 1.53675 CAD; 1 USD; 88.7755 YEN; (i.e. all numbers are relative to the USD base currency).

The desired amounts indicated on Figure 2A reflect the mid-market value of the available currency. The post-match situation using this embodiment is shown on Figure 2B.

It will be noted that the limiting factor in this match example was the availability of CAD for JPY.

The embodiment uses a "currency link" to match partially or fully the desired quantities of the match. A currency link is created using the source currency and the beneficiary (desired) currency for a series of transactions. Figure 2C illustrates a simple three-way currency link.

Note, that if, for example, Party C wanted a currency other than AAA, say DDD, there would not be a currency link from which to synthesize a transaction.

A link is therefore defined as (A to B; B to A); or (A to B; B to C; C to A); or (A to B; B to C; C to D; D to A) etc. A mathematical relationship at a point in time therefore exists between the currencies. Another example is A to C, B to A and C to B.

5 The distinction from traditional netting programs is three-fold. First, netting in the present embodiment happens in "real-time", not at a fixed point in time post transaction for various parties, none of which are necessarily the same from one "link" to the next, and consequently, from one "match" (whole or partial) to the next. Second, the program is designed to seek out the "currency linking" through a
10 combination of user defined parameters and system transaction rules. As complete matches occur (as in A above), the matched party drops out of the matrix or queue. The program seeks out the next currency links based on a set of transactions rules to fulfill wholly or partially the next match. Third, traditional netting occurs on completion of a series of transactions. For example, if Party A is obligated to pay Party
15 B three units of a currency and Party B is obligated to pay Party C three units of a currency, a netting transaction would have Party A pay Party C three units of currency directly. In this embodiment, transactions are synthesized by matching source (available) currency to beneficiary (desired) currency requirements. As such the transaction could be deemed a netting 'hybrid'.

20 The present system may be further understood with reference to Figures 3A and 3B, which each show a schematic of the major elements in a foreign exchange matching system in accordance with the present invention. Figure 3A is an actual proposed architecture schematic for an FX embodiment prepared by Primix Solutions Inc; the
25 embodiment is called 'BuyFX'. The functions of the major blocks in Figure 3A and 3B are the same and are as follows: the party and counterparty each interact with the foreign exchange matching system using their web browsers (1, 2), which communicate via the Internet 3 with a conventional Web cluster/firewall 4 connected to an application server cluster 5 running Netscape Application Server, IBM
30 WebSphere or BEA WebLogic. Cluster 5 is connected to a message bus 7, such as

WO 01/20508

PCT/GB00/03511

13

ActiveWorks or Tibco. The message bus 7 is connected to a live data feed 6, which provides continuous and up to date pricing information. A Reuters or Bloomberg feed could be used. Message bus 7 is also connected to a mail server 8 which communicates with various entities, including the party and counterparty.

5

Message bus 7 is also connected to the matching system server 9, which runs a Java or C++ program calculating not only the mid-point prices (and related spreads, if applicable) using data from the live feed 6 but also identifying where netting opportunities exist to enable a currency match to occur and the nature of the netting.

10

Matching System server 9 is connected to an Oracle database 10. Message bus 7 is connected to the various system financial partners 11 (typically one, but not limited to one, in each jurisdiction whose currency is available for matching through the system). These are typically banks or deposit taking institutions. These partners actually take the payment from and make payments 12 to each party and counterparty in the amounts defined by the matching system server 9.

15

Reference should now be made to Figure 4, which is a step by step walk through the process. Figure 4 includes, but is not limited to, the denoted steps to execute a transaction. At step 1, a party with a need for foreign exchange logs onto a secure web site using its browser. Initially, the party has to complete a customer profile and user authentication. This involves the following steps: On entering the secure FX Matching System web portal, the customer has to:

20

- (A) Register with the FX Matching System and its jurisdictional banking partners in a secure environment (if a new user), or
- (B) Authenticate its identity with a user name and password (if an existing user).
- (C) If a new user, it also has to enter various administrator-defined restrictions- user restrictions, currency restrictions, volume restrictions e.g. User "XXXX" can transact in currency "XXX" and "YYY" only, in volumes not to exceed "XXXXXX".

25

(B) 'Match (All or none)' – the exchange transaction is completed only as and when a complete block of currency (as a series of partials or in one reciprocating block) becomes available to fulfill a currency order; (again, this can be time-sensitive);

(C) 'Match and Market (M & M's)' – a time sensitive order to fill the customer currency requirement with as much "matched" currency as is available during a user-defined period of time, with the option of executing the balance at the prevailing market rate with a banking partner or financial institution.

(D) 'Market' – an order allowing a customer to bypass the matching process and go directly to a jurisdictional partner for execution; this can be time-sensitive;

(E) 'Special Liquidity' – certain corporate partners, and, in some circumstances, regular customers will be able to submit orders at preferred rates to augment liquidity. "D-SL" orders never have precedence over regular "Direct" orders.

The Submissions Document is then securely transmitted (step 2) to the Matching System Server (B). The Matching System Server (B) then requests (step 3) the appropriate financial institution (C) to verify the information given by the party (including the availability of funds) and to authenticate the user from the financial institution's perspective. An account held with this multi jurisdictional financial partner(s) serves nothing but a transactional purpose through which funds are matched and distributed. The multi jurisdictional financial partner(s) accepts funds on account in the currency by which they were deposited. Correspondingly, this institution delivers funds to the customer in the beneficiary currency at the prescribed rate of exchange. All currency exchange is electronic so that no physical securities are required for clearing.

Once the financial institution (C) has confirmed that the user has the required funds to be exchanged it in effect freezes those funds, and then authorises the matching system (step 4) to post the required information and proceed with the transaction. The Matching System (D) then performs the netting identification process illustrated at Figure 2B, using the mid-point prices it calculates using the data from live feed (A).

WO 01/20508

PCT/GB00/03511

17

(E) If a customer elects to carry an order over a number of days, until that order is filled in its entirety, the direction to pay upon to a Payee Account remains unavailable. In that circumstance, the customer must maintain his own beneficiary account.

5

In addition to handling International Payment Instructions, the system can equally well handle Domestic Payment Instructions – for corporations who seek to transfer funds domestically.

10

In addition to issuing the International Payments Instruction, the Matching System (D) records the transaction details and time-stamps them. Pricing is also screened by the Matching System (D) for anomalous trades to ensure transaction integrity. Matching System (D) also causes an e-mail customer notification of a match to be issued, pending final payment and settlement.

15

Payment instructions are then confirmed, aggregated, and reconciled at the financial partner. Payment is subsequently effected (step 6) to the denoted beneficiary accounts (payee or customer). Each jurisdictional banking partner will release funds at the earliest available opportunity after the daily batching function. Confirmation details are recorded for transmission to customers; confirmation email and online transaction reporting details are transmitted to each customer (step 7). Call centre functionality allows customer to gain transaction details should their ISP be experiencing technical details. At step 8, each customer can obtain a transaction confirmation certificate (Step 9). The transaction is now fully completed.

20

25

There are various additional aspects to the FX Matching System, which are not illustrated. For example, a product for individuals (business travelers) is available; as is a corporate wholesale product for intermediary exchange requirements; and a “market” product for blue-chip multinationals. The transaction size in these incarnations may dictate the transactions “fee” for executing a currency match; the

30

WO 01/20508

PCT/GB00/03511

18

program could, but does not have to automatically categorize the trade into the appropriate product with the appropriate rate scale.

Another use of the system is as an intra/inter corporate netting and money management facility (see The Mechanics of Netting Figure 5), in which currency requirements can be met as the intra corporate currency becomes available in other jurisdictions.

A hedging facility for foreign exchange exposure may also be included, in which matched forwards can be offered by the jurisdictional financial partner.

In addition, exposure positions are available to the multi jurisdictional financial partner(s) to mitigate systematic risk with one another.

The system can be implemented as a series of scalable products available for distribution through many different channels through the Internet; the customer may enter the system directly through the denoted web site to transact; the customer may enter via the web site of our multi jurisdictional partner(s) in a co-branded product, or the customer may enter via the web site of a multi jurisdictional partner in a "partner-branded aka white-branded" or non-branded interface. For the retail individual, an affiliation between the present system and a courier and travellers cheques company is possible. This enables a transaction to be completed anywhere in world with the traveller's cheque couriered directly to the individual. This is envisaged as a premium service delivered via the Internet.

As explained above, the system can provide cross-border settlement of accounts, converted to the currency of choice, at exchange rates that represent the closest to fully efficient currency markets. This is particularly advantageous for the small/medium corporate user

Clearing transactions

In a preferred embodiment, there is a central clearer (or a group of clearers, presumably financial institutions), with access to the jurisdictions in which currency is both sourced and required. This could be a single financial institution or trustee, or a group of financial institutions or trustees which can secure the transactions. An account held with the clearing body serves nothing but a transactional purpose through which funds are matched and distributed. The central clearer or its affiliates should have the ability to accept funds on account or with a financial institution in the currency by which they were deposited. Correspondingly, this institution delivers funds to the customer in the beneficiary currency at the prescribed rate of exchange. All currency exchange is electronic and no physical securities are required for clearing.

Payment & Settlement

The simplest scheme involves 2 parties in 2 countries with equal and off-setting obligations. In the United Kingdom, imagine that a party C¹ has £1million GBP (Great Britain Pounds) in available funds in a bank account in the United Kingdom and needs to pay \$1.5million (US dollars) to its supplier A in the US. In the US, party C² has \$1.5million in available funds in a bank account and needs to pay £1million to its supplier B in the UK. Assume for simplicity that the exchange rate is \$1.5 per GBP. Conventionally, C¹ might wire transfer \$1.5million (US dollars) to supplier A in the US: that process involve the complex steps involving numerous parties explained in the Description of the Prior Art section of this specification.

Likewise, C² might wire transfer £1million to supplier B in the UK, with equivalent steps. This prior art process is however relatively expensive and slow. In the system of the present invention, shown in Figure 1, however, a central computer system is fed the payment obligations of each party, and rapidly spots that a simple swap of obligations is possible. It then causes party C¹'s £1million to be paid to supplier B in settlement of C²'s payment obligation to supplier B and also causes C²'s \$1.5million to be paid to supplier A in settlement of C¹'s payment obligation to supplier A.

As noted above, this rudimentary 2 party example is offered as an introductory example of the underlying concept. In practice, there will likely be many parties and many countries.

5

As a somewhat more complex example, a 3 party example would operate as follows. In this example, a new intermediary, BuyFX.com, is introduced. BuyFX.com operates the central computer system underlying the present invention.

10

Assume the following simple scenario, depicted in the table at Figure 1.0 below:

- Corporations: C^1 , C^2 , C^3
- Corporation's Domestic Financial Institution: $FI^{(1)}$, $FI^{(2)}$, $FI^{(3)}$
- Corporation's Foreign Financial Institution: $FI^{(1)^*}$, $FI^{(2)^*}$, $FI^{(3)^*}$
- 15 • BuyFX.com's Correspondent Banking Partners: FI^{BX1} , FI^{BX2} , FI^{BX3}
- C^1 - Owns GBP; Requires USD;
- C^2 - Owns USD; Requires YEN;
- C^3 - Owns YEN; Requires GBP

20

In this example, C^1 cannot satisfy its requirements in whole or in part by dealing with C^2 exclusively. However, if C^3 can be "linked" into the transaction, all three corporations can be satisfied to the value of the smallest available currency.

25

Therefore, in simple terms, if C^1 's USD requirement could be satisfied via C^2 , C^2 's YEN requirement via C^3 , C^3 's GBP requirement via C^1 , you could reduce the number of participants in any leg of a transaction. That is, the various "cross border" elements of a transaction become nothing more than a series of netted domestic transactions.

Where previously there could be 18 or more participants over 3 transactions, there is now a maximum of 15, with a minimum of 9 (assuming distinct financial institutions in each jurisdiction).

5 The relationship and methodology to achieve this end is depicted in Figure 1.

The fundamental requirements for this system are:

10 • A central computer system, networking participating financial institutions, which calculates transfer amounts and electronically instructs financial institutions in the area of funds direction. (FEDI)

A network of financial institutions (one or more), which has available to it the mathematical and communications software to relay customer instructions regarding the transfer of funds to a payee.

15 A central computer system, which uses batch file processing to execute recorded transactions and direct payments accordingly.

Referring to Figure 3, each party using the BuyFX.com system (i.e. C¹, C², and C²) instructs its own domestic financial institution that it requires a foreign exchange payment to be made. That can be done in several ways; for example, each party could access a BuyFX.com web site and enter the details of the amount and the payee; it would previously have entered into a mandate with BuyFX.com so that any instructions given by it in an authorised manner to the BuyFX.com web site triggers an automated debiting of cleared funds from that party's bank account into the BuyFX.com correspondent bank. Hence, when C¹, which banks in GBP, instructs its bank FI¹ that it wishes a USD payment to be made to its US supplier, then, the equivalent amount in GBP is debited from the cleared funds in the account of C¹ held at FI¹ and transferred to FI¹. Generally, that will only occur after the Central System of BuyFX.com has determined that a match can be established which will lead to a full or partial satisfaction of several parties payment obligations. That requires the

Central System to monitor all foreign exchange requests, and, when it spots a match, to inform the BuyFX.com correspondent banks, $FI^{B1 \setminus 1}$, $FI^{B1 \setminus 2}$ etc, over the FEDI network. The BuyFX.com correspondent bank in a given jurisdiction then pulls payment from the payer's domestic financial institution and forwards it to the foreign financial institution acting for the party who wishes to make a payment to a payee in that same jurisdiction (e.g. in the case of GB in Figure 1, the payee in GB is C's supplier, where C is based in Japan. Hence, the BuyFX.com correspondent bank in GB sends the GBP it has obtained from C's bank money to C's GB foreign financial institution, $FI^{C \setminus 3}$, who then passes it to the GB payee in satisfaction of C's debt to that payee.

Further detailed aspects of an implementation are contained in the following appendices, in which:

1. Appendix 1, which details the searching methodology and algorithm; and
2. Appendix 2, which details the transaction aging procedure and the order of operations; and
3. Appendix 3; which details the matching algorithm and netting (hybrid) procedure

Appendix 1 – The Searching Methodology and Algorithm

1. Each currency is assigned a unique base ten exponential value henceforth known as an Assignment Value (AV) see Table 1.0 below. Example: GBP-AV = 1.E+02
 2. Source Currency Assignment Value (SCAV) e.g. SCAV for USD = 1.E+00
Beneficiary Currency Assignment Value (BCAV) e.g. BCAV for CAD = 1.E+01 see
- 10 Glossary of Terms.

Table 1.0. Assignment Values

#	Currency	Values	Exponential
1	USD-AV	1	1.E+00
2	CAD-AV	10	1.E+01
3	GBP-AV	100	1.E+02
4	JPY-AV	1000	1.E+03
5	EUR-AV	10000	1.E+04
6	AUD-AV	100000	1.E+05
7	CHF-AV	1000000	1.E+06
8	ZAR-AV	10000000	1.E+07

3. To distinguish between currency combinations, one aggregates the assignment values of the underlying currencies. Example CAD/GBP/EUR = 10110. No other currency grouping can generate this assignment value. Each grouping has its own unique assignment value.
4. Key to the process is that no combination of assignment values can be aggregated to equal the assignment value of any other currency. A base ten searching mechanism provides this characteristic.

For a 20 currency environment, with a maximum of 6 participants to any one transaction:

11. Source Currency Assignment Value (SCAV) is compared to the Beneficiary Currency Assignment Value (BCAV) to generate the match(es).Where the $SCAV = BCAV$ for the same subset of clients, a match exists.

Numerical Example: Searching Methodology

Assumptions

b. All transactions entered at time $t=1.0$; hence no transaction in the example has precedence based on time.

14. AV Matches

Assumptions: In this example, all transactions aged identically at $t=1$

Assumptions: In this example, all transactions aged identically at $t=1$								
Match 1	1.E+01	1.E+05			1.E+00	1.E+04		
SCAV	110011	USD,CAD,EUR,AUD				BCAV		110011
Match 2	1.E+06						1.E+00	
SCAV	1000001	USD,CHF				BCAV		1000001
Match 3	1.E+01	1.E+03	1.E+00	1.E+02				
SCAV	1111	USD,CAD,GBP,JPY				BCAV		1111
Match 4	1.E+06				1.E+00		1.E+07	1.E+04
SCAV	11010001	USD,EUR,CHF,ZAR				BCAV		1101000
								1

10 15. By comparing the aggregated assignment values of the source currencies against the beneficiary currencies, one can discover the matches. Where the values are identical, there is a match.

16. Mathematically, this is illustrated as follows. $SCAV - BCAV = 0$ (Formula 1.1)

Appendix 2 – Transaction Aging Procedure and Order of Operations

1. While the Searching Algorithm provides a very clear methodology to exposing matches mathematically, Consideration must also be given to:

- i. the Transaction Aging Process
- ii. the Order of Operations

2. The Transaction Aging Process is a time-based order management procedure through which entries are prioritized on a first in, first out basis, subject only to the parameters and limitations of either the BuyFX.com Transactions Rules or User Defined Parameters.

3. **Order of Operations** is a combination of Transaction Rules and User Defined Parameters, which necessitate unique treatment of the data entry in question. For example, if a customer tags the "All or none" order, the system must provide for this restriction by ensuring that the complete execution of the order can occur prior to engaging this entry in any transaction.

- #### 4. The Transaction Aging Process

- i. Given that the user entry requires no special treatment in relation to the BuyFX.com Transactions Rules, and that the entry is not tagged with a user defined limitation, precedence of one entry over another is exclusively time based. In other words, the first entry into the system will, *ceteris parabis*, have priority over any subsequent entry.

- ## 5. Example 1.0

Table 1.0: Assignment Values

WO 01/20508

PCT/GB00/03511

30

#	Currency	Values	Exponential
1	USD-AV	1	1.E+00
2	CAD-AV	10	1.E+01
3	GBP-AV	100	1.E+02
4	JPY-AV	1000	1.E+03

Randomly entered data points denoting the following transactions conditions:

At $t=1.0$; USD-SC; CAD-BC, therefore $SCAV = 1$, $BCAV = 10$

At $t=1.1$; EUR-SC; USD-BC, therefore $SCAV = 100$, $BCAV = 1$

At $t=1.2$; CAD-SC; EUR-BC, therefore $SCAV = 10$, $BCAV = 100$

At $t=1.3$; USD-SC; EUR-BC, therefore $SCAV = 1$, $BCAV = 100$

where SC is Source Currency & BC is Beneficiary Currency

6. Transaction Aging Procedure

	SC	USD	CAD	EUR	JPY
	SCAV	1	10	100	1000
BC	BCAV				
				T=1.1,	
USD	1			AV=1	
CAD	10	T=1.0; AV=10			
		T=1.3,	T=1.2; AV=10		
EUR	100	AV=100	0		
JPY	1000				

5

7. AV Matches by Age

- I. At T=1.0 No match
- II. At T=1.1 No match
- 10 III. At T=1.2 Match SCAV=BCAV=111
- IV. At T=1.3 Match SCAV=BCAV=101

Notes:

- 15 I. Match at T=1.3: if USD and EUR
remaining in the queue after Match at T=1.2.
- II. If USD or EUR supply exhausted at
T=1.2, Match at T=1.3 will not occur.
- 20 III. If observation at T=1.3 occurs prior
to T=1.2, Match AV=101 will have priority over Match AV=111. In this

WO 01/20508

PCT/GB00/03511

32

example Match $AV=111$ will not occur as one, of either, USD or EUR would be exhausted.

Appendix 3 – The Matching Algorithm

1. By combining the BuyFX.com Searching Algorithm with the Transactions Aging Procedure, AV Matches can be discovered. (see BuyFX Searching Algorithm and BuyFX Transaction Aging Methodology & Order of Operations)

2. When an AV Match is discovered via the BuyFX Searching Algorithm, at least two clients will be party to the transaction. The limiting factor to the transaction will, therefore, be the least supply of currency (or the smallest Source Currency Quantity or SCQq) among the parties to the transaction. eg. Assume AV Match = 101 (GBP and USD); one client has 100,000 USD for GBP and another has 100,000 GBP for USD; USD/GBP = .62225; the limiting factor to this transaction is the SCQq of 100,000 USD. Therefore, the client with SC=USD and BC=GBP will receive all of his desired GBP and drop from the queue. All other parties will remain in the queue subject to user parameters and transaction rules.

3. To calculate the amount of currency allocated to each of the parties in a transaction:

A. Each supply of currency is denoted in a common or base currency equivalent form. Since USD is the global standard against which all currencies are typically quoted, USD will be used as the base currency for these calculations. Formula 1.0 describes a currency in terms of the base currency, in this case, USD.

Formula 1.0:

$$Q^{\text{USD}}(\text{SC in Base terms}) = \text{SCQ} / \text{SC FX Rate as against the Base Currency}$$

$$\text{or } Q^{\text{USD}} = \text{SCQ} / R^{\text{USD}}$$

Example: To calculate JPY in USD terms, $R=109.45$, $SCQ=109,450$ JPY

$$Q^{USD} = SCQ^{JPY} / R^{USD/JPY}$$

$$Q^{USD} = 109,450 / 109.45 = 1000 \text{ USD}$$

Therefore, at time t , 109,450 JPY was equal to 1000 USD.

B. The SCQq is determined, thereby defining the limiting source and quantity of currency against which the other participant volumes can be calculated. Each party to the transaction will undergo the calculation denoted in Formula 1.1 to determine the supply of currency which that particular client will contribute to the transaction (SCQ^i)

Formula 1.1: .

$$SCQ^i (\text{quantity supplied to the transaction}) = SCQq \times \text{Source FX Rate as against the Base Currency}$$

$$\text{or } SCQ^i = SCQq \times R^{USD/SC}$$

Example: To calculate the volume of source currency contributed to a transaction.

$$\text{If the } SCQq = 10 \text{ USD, and } R^{USD/GBP} = 0.62225,$$

$$SCQ^{GBP} = 10 \times 0.62225 = 6.2225 \text{ GBP}$$

Therefore, the client with SC=GBP would supply 6.2225 Pounds to this transaction and the client with BC=GBP would receive 6.2225 Pounds as a party to this transaction.

WO 01/20508

PCT/GB00/03511

36

4 Consider the following example.

- Client B has 15 CAD as Source Currency Quantity (SCQ) and requires X JPY as Beneficiary Currency Quantity (BCQ)
- Client H has 3000 JPY as Source Currency Quantity (SCQ) and requires Y CAD as Beneficiary Currency Quantity (BCQ)

The prevailing foreign exchange rates are noted in the Table below:

**Sample
Transaction**

Client	SCQ	FX Rate	SCQ (in USD)		BC	Residual SCQ ^R
		(see Table 7.1)	Formula 1.0	BCQ		
B	15	1.45425	10.31	1128.93	JPY	0
H	3000	109.45	27.41	15.00	CAD	1871.068

SCQ_q = 10.31 USD

Therefore,

Applying the calculation

WO 01/20508

PCT/GB00/03511

38

6. A. All details of the transaction will be stored to a database for
aggregation & “batch payment and settlement”
- 5 B. As currencies fluctuate against the USD, calculations will be
generated from live data to supply the client with “real-time” competitive
pricing.

11. Glossary of Terms

SC Source Currency - the available currency i.e. the currency to be converted

BC Beneficiary Currency - the desired or destination currency i.e. the currency into which the source funds will be converted

AV Assignment Value - an identifier used to distinguish one currency from another
eg. GBPAV= 1.E+02; AVs are used to source matches between clients (see Searching Algorithm). Currency pairs or multiples have unique AV totals (see Table 7.2); for example, a pairing of CAD & GBP is identified by 110; GBP & USD by 101; CAD & JPY by 1010 etc.

SCAV Source Currency Assignment Value - the value assigned to the source currency of a client transaction e.g. if client has GBP for conversion to CAD, SC = GBP, therefore SCAV =GBPAV= 1.E+02 (see Table 7.2)

BCAV Beneficiary Currency Assignment Value - the value assigned to the beneficiary currency of a client transaction e.g. if client has GBP for conversion to CAD, BC = CAD, therefore BCAV =CADAV= 1.E+01 (see Table 7.2)

AV Match Assignment Value Match - by definition, a match occurs when the Source Currency AV of two or more parties is equal to the Beneficiary Currency AV of those same parties; SCAV=BCAV or SCAV-BCAV=0 eg. If one client has GBP to convert to CAD and another client has CAD to convert to GBP,

$$SCAV = GBPAV + CADAV = 110 = BCAV = GBPAV + CADAV$$

SCQ **Source Currency Quantity** - the amount of source currency to be converted

5

BCQ **Beneficiary Currency Quantity** - the amount of beneficiary currency available post-transaction(s)

Q^{USD} Represents a Source Currency in USD equivalent terms; used to compare the SCQs of the participants in a transaction to discover the SCQq (see below)

10

R **Foreign Exchange Rate** - the amount of one currency required to procure another

15

eg. If 109.45 JPY = 1 USD; $R = USD/JPY = 109.45$

15

SCQq Represents the limiting factor to a transaction, the SCQq is the smallest SCQ (or SCQ^R), as denoted in USD terms, from the participants to a transaction.

17

SCQ^T Represents the quantity of currency contributed by a client in executing a transaction.

20

$$SCQ^I = SCQq \times R^{USD/SC}$$

SCQ^R Represents the residual currency post-transaction available in the queue for future matches.

25

$$SCQ^R = SCQ - SCQ^I$$

WO 01/20508

PCT/GB00/03511

50

Queue All of the SCQ'S available for transactions, prioritized by system transaction rules and user-defined parameters.

Claims

5

1. A method of multi-currency funds settlement comprising the following steps:

10

funds in a currency X of a first legal person who is situated in country X' are transferred in whole or part within country X' to satisfy in whole or part the currency X' payment obligations of a second legal person, situated in a different country Y';

15

and the funds in a currency Y of that second legal person situated in country Y' are transferred in whole or part within country Y' to satisfy in whole or part the currency Y payment obligations of a legal person, who may be the first legal person or one or more different or additional legal persons.

20

2. The method of multi-currency funds settlement as defined in Claim 1 in which each legal person seeking to transfer foreign currency enters into a computer program an amount of foreign currency required and an applicable payee.

3. The method of Claim 2 in which the computer program is hosted on one or more web servers.

25

4. The method of any preceding claim in which funds which are transferred to a payee in a given jurisdiction are generated from a series of debits and credits passing back to a debit of cleared funds of a bank account held by a legal person in that same jurisdiction, that legal person not seeking to transfer funds to that payee but to a payee in a different jurisdiction.

30

5. A computer program receiving data defining the non-domestic payment obligations of parties located in two or more countries, and programmed to identify

opportunities to satisfy those non-domestic payment obligations by assigning payment obligations using the funds settlement method defined in Claim 1 - 4.

6. A computer server programmed with the computer program of Claim 5.

7. A computer terminal acting as a client, in which the client accepts from a party a foreign exchange requirement and sends that requirement to a server as defined in Claim 6.

8. A computer based system which enables parties located in two or more jurisdictions to meet their foreign currency payment obligations, comprising a first computer terminal into which a party located in a first jurisdiction inputs details of a potential first foreign currency financial transaction, a second computer terminal into which a second party located in a second jurisdiction inputs details of a potential second financial transaction, a computer network connecting the first and second terminals: characterised in there being a computer program arranged to determine if any transfer of funds from the first party to a payee located in the first jurisdiction satisfies in whole or part the requirement of the second party to transfer funds to that payee.

9. The computer based system of Claim 8 in which there are numerous computer terminals in numerous countries and the computer program is arranged to determine if any transfer of funds from a party to a payee located in the jurisdiction of that party satisfies in whole or part the requirement of another party to transfer funds to that payee.

(54) Title: METHOD AND APPARATUS FOR MULTI-CURRENCY FUNDS SETTLEMENT

(57) Abstract: Cross border multi-currency payment obligations are met not with conventional complex and expensive FX transactions, but instead with legal persons (typically corporations) in different countries in effect assigning payment obligations so that funds of a party in one country remain in that country and are used to meet the payment obligations in that country of a party outside of that country.
